2.5 ft.

30 ft.

● **Unheated**

● **Heated**

- Electric
- Hot Water
- Steam
- Indirect Gas
- Direct Gas

● **Chilled Water**

The bigger the door, the greater the loss. Eliminate your \$\$\$ rushing out the door with a Powered Aire Air Curtain.

Motion Sensor Sees what's coming

Before this door even opens, the air curtain mounted inside the entranceway has begun working to save you energy. How?

Our motion sensor will turn the air curtain on a couple of seconds before the door opens, so that it is up to speed and fully effective the entire time that the door is open. Use two, one for incoming and one for exit traffic.

Mini-Power Air Curtain

Still only 8.5-inches high!

Low profile air curtains are typically used in applications where there is a low ceiling and limited room between the top of the door and the ceiling. Our competitors' low profile units requiring 480 or 575 volts will either need an extra 120 volt supply for the motors, a transformer mounted directly on top of the unit, or a transformer mounted remotely.

Mounting a transformer on the unit means:

- * The air curtain may not fit.

Mounting the transformer remotely means:

- * Extra cost to mount it in the field.
- * Extra cost to supply it.
- * It could become an eyesore unless extra care (and cost) is taken to hide it from public view.

Adding another supply line means:

- * Extra cost for wire and labor during installation.

Powered Aire's Mini-Power with 480 or 575 volt heaters no longer requires a separate 120 volt power source to run the motors, which will make the installation lighter and more aesthetically pleasing while at the same time saving your customer time, money and valuable space!
