

Jack Frost is Knocking. Don't Let Him in.

Heated Air Curtains from Powered Aire

**Direct Gas-Fired
Air Curtain**

**Indirect Gas-Fired
Air Curtain**

REGULATORS FOR GAS HEATED UNITS NOW AVAILABLE FROM POWERED AIRE

A regulator must be used when a building's gas pressure is higher than Air Curtain's maximum allowable amount.

Frigid winter winds can wreak havoc on heating costs, worker comfort and overall productivity.

Often times, a building's heating system cannot effectively heat the dock, block the infiltration of chilled air and keep employees warm. The non-stop running of heat can also send utility costs through the roof—or out the door in this case.

Powered Aire's Gas-Fired Air Curtains create a heated barrier to keep workers warm, energy costs low and Jack Frost outside! Our new gas regulators provide additional functionality to ensure performance in an even wider range of applications.
